

CASE STUDY – Restoration / Domestic Use

1. Location: A new luxury house build (400sqm)

Reported Concerns:

- Large areas of unsightly mould appearing on certain internal walls on all 3 floors suggesting an underlying damp problem
- Breathing issues apparently caused by spores and damp odours

Solution: In addition to review and repair of the damp proofing work Odorox® SlimLine units were rotated between the affected areas during a period of 5 days.

Result: Breathing problems improved within 48 hours and by day 5 all mould was dead and was easily washed off with soap and water and did not reappear.

2. Location: Urban house set on 4 floors (250sqm)

Reported Concerns:

- Concern about internal air quality due to outside traffic
- Family allergies

Solution: Two Slimline units were positioned strategically, 2 floors apart, in louvered cupboards and run intermittently on timers.

Result: Although not measured analytically air quality was considered to be 'improved' and the occupants are running a long term record of allergy, illness and sleep improvements as have been reported by many other domestic adopters of Odorox® units.
